Please replace the paragraph beginning at page 11, line 15, with the following rewritten paragraph:

-- The zeolite compounds are alkali or alkaline earth metal aluminosilicates having a unique three-dimensional zeolite crystal structure. Typical examples of the zeolite compounds are zeolite A, zeolite X, zeolite Y, zeolite P, ~~menedenite~~ mordenite, analcite, sodalite, clinoptilolite, erionite, and chabazite. These zeolite compounds may be either a hydrate having water of crystallization (so-called zeolite water) or an anhydride obtained by removing water of crystallization. Those having a particle size of 0.1 to 50 μm , preferably 0.5 to 10 μm , can be used.--

Please replace the table beginning at page 25, Table 4, with the following rewritten table:
